## Introduction

Finally! Some golf tips that actually help. Stop what your doing, what your thinking, what your working on and ENJOY reading “ *Golf Simplified: Eliminate Strokes Right Away: 21 Simple and Effective Tips To Help You Instantly Improve All Aspects of Your Game* ” . Remember your most likely not getting paid to to play golf...your paying to do it, so have fun. Alright let's get into it!

This book has over 21 valuable easy to follow tips to help you improve different aspects of golf.

Golf, often associated with the rich and mighty is undoubtedly a cool game to play whether you want to do it just for the fun of it, to pass some time when meeting a prospective client or to improve your knowledge of the sport and possibly become a professional player. Nonetheless, although knowing the rules and the terms is okay, this is just the first step.

It seems so easy when you see the pros doing it but when it is your turn to drive the ball in the direction you want with absolute precision; this becomes more like a farfetched dream. It just does not work. This is definitely frustrating but getting frustrated won't fix it; you must learn how to drive the ball because this in itself requires skill and practice if you are to become good at it.

This book is all about improving every aspect of golf in order to ultimately eliminate strokes immediately. You will discover effective driving tips, iron and wedge shot tips, putting tips and a lot more. After reading this book, you will be able to start applying what you've learnt right away. You will also discover how your mindset could have been the real problem behind you struggling to improve your game.

Thanks again for downloading this book, I hope you enjoy it. It's time to learn!

## Driving Tips

### Drive Long Fly Straight

The best part of playing golf is arguably bashing drives across the fairway. A great drive leads to a low score, and once you are confident with your game, the rest of the game will usually follow suit. As far as better driving advice is concerned, it is important to keep things easy and straightforward, for a simple reason. Better drives call for less body clutter and mind.

#### ***#1: Find a power grip***

Left: When you place your gloved hand besides your body, where are your palms facing? For most people, the palms face inwards toward the leg. You can determine how you hang your hand by standing against a full-length mirror, paying close attention to the direction of the hands.

Right: It is much more efficient to hang your hands with the thumbs slightly inwards towards the body. If this is not the case, you may want to adjust your grip in order to boost the power of your tee shots.

You are more likely to get a weak and flimsy grip when you hold your club like you naturally hang your hands, which may lead to shorter shots, and sometimes extra slice spin and highball flights.

You can add power by using a more sturdy left hand position to grip the club. Just be sure to turn the hands before gripping the club.

## ***#2: Miss the box***

Angle of attack refers to the direction in which the club head moves towards the back of the ball. The angle of attack can be level, upward, or downward. In any case, it depends on the length of your clubs. Longer clubs are usually associated with shallower angles of attack, with the exception of the driver. If you are struggling with the driver, it's probably because you have a very steep angle of attack, which can be caused by the head getting too close to the golf ball before being hit by the club head. This leads to a significantly steep swing that causes unpleasant pop ups. If you are familiar with pop ups, try this easy drill. Place a sleeve of balls about twelve inches ahead of the ball

you are trying to hit. The aim is to achieve an escalating angle of attack and not hit the sleeve of balls.

### ***#3: Start ahead***

You are probably aware that a powerful driver has a great expansion of the arms beyond the golf ball. Once the impact has been made, both arms reach out to the target while the body keeps on uncoiling and rotating towards the forward side. The problem is that most amateurs are not quite as efficient as long hitters are. Collapsing your arms after the impact can cause you to lose plenty of power, leading to the notorious “chicken wing” left arm. Perhaps you are wondering what the big deal is with how the arms settle after impact. The purpose of any powerful swing is to establish distance in the early follow through and the backswing. This is the extension we are talking about here. Collapsing after impact means that you are not trying to hit through the ball

but rather into the ball, making you lose a lot of power. You need to change your mindset and try extending all in during and after impact, and you will subsequently end up with longer tee shots.

An excellent drill for this is to begin with a great extension position with your golf club, as illustrated in the picture above. Then, take a swing back and try to return to the initial position as you do a downswing. It is advisable to start with a few practice swings before proceeding with a golf ball. With time and practice, you will achieve a greater extended position after contact using this drill, which will make you hit straighter and longer drives.

#### ***#4. Swing faster***

One of the important things about golf is having the ability to hit the golf ball with the highest speed possible. However, achieving this involves more than

simply swinging harder. In fact, it is all about swinging faster. The best way to achieve a faster swing is by making a bigger and stronger coil from afar the golf ball. As such, if you want to really boost your next drive, practice taking a few swings while holding your club across the shoulders, as illustrated in the picture above. If you observe the photos carefully, you will find that there is an iron from the instep of the golfer's right foot, placed perpendicular to the golf ball. The purpose of holding the club against his upper chest is to spin the club such that the shaft across his chest becomes parallel and directly over the iron lying on the ground. When you do this, you will add some significant distance to your turn, as well as achieve the ability to shift your weight to the left leg while loading up to the best of your backswing.

Your body will have accumulated so much force at the top of your swing, allowing your tendons and muscles to release all the built up energy while shifting your weight to your target. Just be sure to allow your body to unwrap in a cramped manner, meaning let your lower body, upper body, hands, arms, and club head accelerate during the downswing, instead of firing on every cylinder from your top.

#### ***#5. Hit higher and longer drives***

When it comes to the golf swing, it can be easy to become overly obsessed with moving your body towards your target. Of course, the end goal is to do exactly that, but as far as what should happen is concerned, it all comes down to the club you are trying to hit, and your plan of launching the ball into the air.

In order to achieve long, high drives, it is crucial that you move your

bodyweight towards your target as opposed to backward during the downswing. While this is relatively obvious, where should you have your body at impact? When it comes to a driver, you should not shift your weight to your left side, as is the case with a wedge or an iron. Here, your goal is to actually stay behind the golf ball after the impact. However, this does not mean staying behind the ball during the swing. Rather, it means being particularly mindful of your swing move in order to shift your weight behind the ball by the time of impact. You can do this by simply setting your head behind the golf ball with your overall weight centered, or even have your hands slightly behind the golf ball for a more dramatic effect. At the time of impact, while your body is still coiled, try maintaining your head at about the same place as it was at the point of impact.

#### ***#6. Turn out your right foot***

There are several ways to achieve a couple extra yards from the tee, including buying a new driver, lowering your driver's loft, changing your ball, getting fit, or hitting the gym. While these are all great ways of achieving a farther hit, there is a simple and quick solution that is relatively easy to master:

turning out your right foot. Many golfers generally have poor flexibility, which makes them produce relatively shorter backswing width. In order to thrive in golf, you need to use limber muscles. When you simply turn your foot out, it becomes easier to achieve a wider arc by turning more during the backswing.

Once you have made that simple adjustment, proceed with your usual backswing and you will realize that you have expanded your arc, as illustrated above. From there, when you have reached your uppermost swing, you need to shift your weight well during the downswing. You can do this by opening your foot up.

## Iron And Wedge Shot Tips

### ***#7. Be the middle ball***

Centeredness of contact is one of the most significant variables in better ball striking. Regardless of the nature of your swing, if you fail to hit the middle of the clubface during impact, it's going to be very difficult to control your distances and hit the ball in the intended direction.

If you want to improve at making impact at the middle of the clubface, just set up three golf balls, each a few inches away from the other, and aim for the middle ball. Ensure that the three balls are directly perpendicular to your intended line. The space left should only be wide enough to make way for the club head without disturbing the 2 outside balls. If you find this too easy, there is another variation. From the initial drill, adjust the position of the ball that is closest to you approximately two inches forward and the one farthest away from you approximately two inches. The space left should only be enough to allow the club head to penetrate without disturbing the other two balls. This will leave the three golf balls aligned diagonally, which will help you hit the middle ball at the center. Either variation will help you achieve a more centered impact on the golf balls.

### ***#8. Hit straighter, longer shots***

If you are like most other golfers, chances are high you never actually pay much attention to your swing plane. Basically, your swing plane is the angle at which you swing your club in relation to the ground. Some people have a steeper swing plane; others flatter ones. The secret is finding out which one is ideal for your game. Being too flat or too steep will lead to a lot of handling on the downswing, causing inaccurate distance, contact, and direction. You can counter this by observing your grips' butt end at the end of your backswing, which should be facing the target line. If you can be able to point your butt end at the target line using a middle iron, the same should be possible with your short irons, driver, woods, and so forth. However, here is where things get interesting. As you stick to this constant, you will find that your natural plane angle becomes a bit steeper when using shorter clubs, and flatter when using longer clubs. This is a good thing. It is ill advised to maintain the same plane angle with each club you have. This will not be effective. Your swing plane should be flexible, with the butt end pointing towards the target line, like shown in the picture above.

### ***#9. Dot your impact***

As said previously, the precision of contact is the most significant aspect of achieving better shots. The way you hit the ball using your club head will affect the curve, distance, launch angle, spin, and your perception of your swing plane. There is a very useful drill that you can use to improve your precision of contact. The only thing you need is two golf balls and a sharpie. Start by drawing a big dot on the golf ball you are using in order to determine the spot you hit when you make contact with the ball. You can do this with a dry erase marker, especially if you are using a driving range ball. This is very effective, and the range ball will not be marked up or damaged.

If you practice with a few balls that are marked with a big round dot, you will soon realize whether you tend to make contact on the heel or the toe of the ball. If you are struggling with the toe, place two balls, 3 inches apart, on the ground, with the dotted ball being the one farthest from you. Basically, the toe shot is caused by hitting the ball when your arms and hands are too close to you. Therefore, this drill will involve addressing ball #1, which is closer to you, followed by ball #2, which is farther away from you. This will help you feel your arms and hands expanding through the contact, and give you the necessary sensation to hit the right spot on the surface of the ball.

If you have a tendency to make most impact on the heel, place the 2 balls down, and do the reverse. The idea is to achieve a better impact spot so that the clubface makes contact with the ball closer to the middle of the clubface. While conducting this drill, try not to concentrate on the results too much, whether it is fixing your toe or heel hits, but rather, fixate on the sensation of the club.

## **#10. Iron power**

As far as iron play is concerned, most people do not think about power. However, more power can work more to your advantage than disadvantage. When you hit longer iron shots, it means that you can manage higher lofted irons often, which are definitely much easier to hit solidly when compared to long irons. In addition, it is usually better to use a shorter iron to swing harder than using a longer iron to swing easier. So, what is the secret to achieving a couple more yards when using your irons? On the picture shown above, the golfer is striking a middle iron, and he is swinging pretty hard. But instead of using his upper body to impact the ball, he is hinging his hands, firing his hips, and straightening his left leg through the hit. Power is not just about muscle; it is partly speed. Consider the three aspects of iron power.

### *Step one*

To really use your power to the maximum, you need to develop what is referred to as lag in your swing, meaning that you have to hold the angle created by the shaft and your left forearm for as long as you can, and then releasing over the ball directly. Generally, you will achieve more speed as you increase this “lag”.

### *Step two*

You have to open your hips through the striking zone. This will free your

upper body to develop a more relaxed swing.

### *Step three*

When it comes to straightening your leg during impact, you can think of it as the last step of shifting down your weight, and into the left leg. However, the secret is recalling how to straighten the leg in the proper sequence. Your straight leg should not be at any other point in your swing beyond the moment of contact with the golf ball. Retaining your knees' flexibility for a longer time will lead to greater energy for releasing when straightening the leg and whipping your upper body across the strike.

### ***#11. What wedges should you carry?***

It is usually recommendable to carry at least 4 degrees of difference among your wedges. The importance of gapping in wedges cannot be over emphasized. Most average players are usually unaware of the loft associated with their wedges. They simply pick up a sand wedge and pitching wedge and take off. This was okay in the old days because majority of the pitching wedges came at approximately fifty one degrees. However, today they range between 45 and 47 degrees, except for the sand wedge that is still 56.

### ***#12. Sole grind***

This refers to the extra curving of the sole of your wedge, which is usually around the toe or the heel. There are various types of sole grinds from different manufacturers, apart from the standard wedge sole, which are specially designed to suit certain shots or turf conditions.

For example, a heel grind removes material from the sole's heel to allow a lower position for the sole on the ground. A grind can enable shot making

chances around the greens. However, sole grinds can adjust the bounce of your sole, which is why it is essential to consult a teaching expert on the variety of grinds that is suitable for your game.

### ***#13.Grooves***

Grooves on a golf club can be thought of as the treads on a tire. There are approximately 15 to 16 grooves, each of which grabs the ball in the same way that the tread interacts with the road, establishing rotation and creating appropriate shot trajectory. Today, there are two different types of grooves: laser etching and vintage finish. Wedges that have vintage finish grooves tend to rust in a manner that supplements the feel and sound characteristic of the metal, while the laser etched ones enhance the friction between the face and ball to create maximum rotation.

## Putting Tips

### ***#14. The toe putt***

Making sure that you have solid impact is one of the most ignored aspects of putting. Few people think about this, but the way you hit the ball when putting can significantly affect how you make putts. In most cases, missed putts are caused by a relatively slow tempo, short follow through, and hesitation during impact. This can lead to twisting of your putter head, improper face angle, and off center hits. So, what should you do to ensure that you hit the golf ball on the sweet spot?

For starters, you can use a standard heel toe putter, if you have one. You can improve your impact with the putter and your tempo by using what is referred to as the toe putt. This simply involves putting the ball with the toe of your putter (rotate your club roughly 90 degrees so you can only use the point/toe of the club to putt, this forces you to focus on the precision of impact). When you practice the toe putt, it will help you achieve solid putting contact more frequently, as well as a follow through that is directed at the target. Once you have given this drill a few tries, revert to the usual way of putting. Chances are that you will find it a lot easier to find and hit the sweet spot of your putter.

There is another use for the toe putt: if you find that, your ball is in the rough or up against the border, you can use the toe putt technique to move the putter against the thicker grass and establish better impact with the ball.

### ***#15. Putt four dough***

Place three balls on the field, approximately ten feet away from the cup. While maintaining your focus on the hole, stroke the first 2 balls. Don't pay

close attention to the ball; simply look at the cup and make good strokes.

Now, return your focus on your ball; but instead of being fixated on the ball, try and maintain the image you had when looking at the cup. This means having a mental image of the hole while making a stroke. Do you feel any difference?

Maintaining this visual improves both your distance and your accuracy. And the bonus advantage is that it eliminates unwanted technical thoughts.

#### ***#16. Get fit***

Of course, the most efficient way to discover your next putter is to hit the field and begin rolling putts. However, it is also important to bear in mind the type of putter you are.

*Select a putter that suits your stroke*

You may be surprised to learn that different styles of putters produce different stroke paths. Since a mallet is a face-balanced putter, if you use it for your putts, chances are you will achieve a square-to-square hit. With that in mind, if you feel more apt to swing on a straighter path, and you currently have a blade putter, it is highly advisable to switch. You are probably having

a difficult time making a straight-to-straight stroke because the blade is heel balanced, which means that the toe of the putter tends to face the ground when you balance it.

Of course, the long putter is the most fundamental move, which produces a very straight path. However, be sure that you are comfortable with the extra length before putting one of these into play.

*Use your setup to determine the putter length*

When putting, your hands should be hanging freely in order to prevent them from bowing out. Consider the training grip shown above. If the golfer lets his arms hang freely, with his eyes looking down directly at the golf ball, he can be able to determine the exact length he needs.

**#17. Five a side**

In order to become better at putting, you need to get yourself used to working with smaller targets. Putting is unique in that it requires a much more advanced level of accuracy. An excellent drill you can use to line five balls on tees, as illustrated in the picture above, space them at approximately a finger-width apart, and then roll a putt from around 5 feet. Try to hit all the tees individually, knocking off the balls one at a time. There are two benefits of this drill. For starters, it will improve your focus when the target is much smaller than the cup. Secondly, you will develop the ability to putt slightly more aggressively in order to make a powerful impact on each tee while knocking down the balls.

***#18. Five in a row***

If you are good at controlling the distance on lag putts, there should be several short second putts left. And if you are comfortable making three to five foot putts, you will definitely lower your scores by saving some shots. You can eliminate more short putts, boost your confidence, and lower your scores using this simple drill. Use five balls to make 5 in a row around the cup from 4 different points. You may find it hard for the first try, but you will quickly gain confidence on making those knee knockers after that. When you have really mastered this drill, move one or two feet back and challenge yourself.

### **#19. *From track to tee***

In case you are missing many putts, the following drill can help you out. If your putts are leading to the ball hitting the tee, you are doing great. However, if you are not getting the tee, observe the following aspects of your stroke: Start by ensuring that you are properly aimed. Your stroke is isolated by the “track”, which makes it easy to aim. However, always check that your clubface is directed square to the target beforehand. You can also be able to determine whether your stroke contains some push or pull using the “track”. If you are finding it difficult to keep your putter in the track when making

your stroke, consider working on your putting path. On the other hand, if you are trying to swing your putter to square from the inside and then back, that is fine. You may miss the tee if your path is not right.

Lastly, if you are still not hitting the tee and your stroke and aim feels good, you are probably using too much clubface spin for your putting stroke. If, during the stroke, you are closing or opening the clubface and not getting back the clubface squarely during impact, the golf ball will not get the tee.

## **#20. Tee party**

If you are having a hard time with your three putting and distance control, it is sometimes advisable to practice a simple drill that shifts your focus from the hole to a different outcome. When you try to be too specific with your goals, sometimes this can work to your disadvantage, especially when lengthy putts are involved. You can fix this by positioning two tees about 3 feet on the upper side of the cup, with one of the tees a few inches before the hole, and the other approximately 3 feet behind the cup. This will basically form a triangle around the hole, and it is where you want your golf balls to wind up after every putt.

Instead of trying to make every putt, you should train your mind and eyes to aim for a bigger target when putting from twenty, thirty, or forty feet and above.

The idea is to use five to ten golf balls to rehearse rolling your putts from twenty, thirty, and forty feet. Continue putting until most of your putts form a triangle from either of those lengths. With practice, you will find that it is much easier to find the bigger target, you have a better chance of making a comfortable stroke, and you will start 3 putting less frequently on the golf course.

### ***#21. Drain it***

If you stand ten feet away from someone else, chances are you can easily toss them a golf ball without your throw being long or short. In fact, it is highly likely you will not think twice about it. You would judge the distance with your sub conscious mind and trust your ability. Now, if tossing a ball is so easy, why do many people have a hard time putting a ball in the right distance? Just like when throwing a ball, you need to reference your previous experiences in order to putt it the right distance. Putting a lot on the fields of varying slope and speeds is more likely to help you gauge your speed accurately. If you haven't played in a while, you may be a little rusty when it comes to distance control. You can also improve your ability to control your throws by thinking of your putts as "tossing" a ball.

### *Use the appropriate putter*

When purchasing a putter, there are several things you need to put into consideration. Style of alignment, face material, and length aids are three factors that come to mind. However, the head style can change your stroke shape completely.

The golfer in the picture above is holding two putters: a mallet and a blade, which are both angled differently. The blade is tilted at an angle, while the mallet is pointing straight up. If you are more inclined to a straight through and straight backstroke, then you are best suited with a mallet. On the other hand, if you prefer to arc your stroke back and forth from your target line to the square, then you should go for the blade. You need to realize that every type of putter will automatically result in a different kind of stroke shape.

## Additional Tips

When it comes to being in control of your ball, it means having the ability to direct the ball the way you want it to. And once you are on the field, it is all about tracking to the cup with the right combination of break and speed. If you can be able to control the ball here, you are going to achieve lower scores. The following secrets can help you enhance your game farther.

### ***#Float it***

When you want to float the golf ball in the air and land it with insignificant rollout, you can establish a wide stance and have your play about center. You place the club completely open, which means that the face of your sixty-degree wedge is pointing straight up. Having a wider stance will keep you stable in order to make a relatively aggressive swing, which helps raise the ball.

In addition, the open face will add loft, as long as you can maintain the loft through contact. The secret to achieving this shot is how you do that. You can use a slight hand/wrist action when the club is just getting to the golf ball. It will happen very fast, but the idea is to slide the clubface below the golf ball just before your hands surpass it. This will ensure that you maintain the additional loft that you stated with at address. When you get it right, the ball

will come off soft and high.

### ***#Bump it***

You can also enhance your game by bumping your golf ball into a hill, and then using the slope to reduce the speed. This is especially handy if you are short sided, and you can't risk a high shot because of the flag being too close to the border of the pitch. You can bump the ball by playing it close to your back foot and using a lower lofted wedge. These alterations will keep the golf down.

The secret to bumping the golf ball is to hit it before the club reaches the ground. If you are looking to flop the ball, you can simply hit it slightly behind, but you will need stable impact here.

### ***#Check it***

One of the best ways to control your ball is to hit it low, allowing it to gain after a few bounces. This technique can come in handy when you are dealing with a lot of green. Open the face of your sixty-degree wedge at address, and then set your ball about center in your stance to ensure that you catch it clean. On the return, hinge your wrists, and then try to maintain a bit of that hinge when coming down. Your hands should be slightly closer to the target during impact than your club head. A good trick to control the speed of the ball is to maintain the club head at close proximity to the ground as much as possible. This will enable the grooves to really grasp the ball and cause a backspin. Swinging up too soon will lead to either poor contact or a too high shot.

### ***#Hole it***

Assuming that you were able to control your ball on the pitch or chip, all that is remaining is a tap in. However, if there's more work left, you need to keep in mind that you have to determine the force with which you'll hit your putt before you figure out how much it will break. This may sound palpable, but several putts come up short because of the golfer neglecting the speed and being too mindful of the slope of the field.

When it comes to breaking putts, you should walk along the lower end of the line and determine the speed first. Once you reach the ball, look back down the line once more to visualize your distance. Take a mental image of the path in which the ball will pass at that particular speed, and choose a spot around midway between where you are standing and the cup on that path.

## **Want to read more about Jordan Spieth?**

Everyone knows the name Jordan Spieth but not many people know about his life before he became the youngest man in 82 years to win a PGA tour event, before he became the first male since 1922 to win two majors before his 22nd birthday, before he broke Tiger Woods' single-year earnings record in 2015 (22 million). This book includes answers to many questions you may have about this young talented man. Questions like...

- 1) What lessons has Jordan learned throughout the ups and downs of golf and life?
- 2) Who does Jordan keep in his inner circle of friends and why do they still make fun of him for failing his driving license test?
- 3) What were his childhood, high school, and college years like?
- 4) How does he stay humble in the midst of world renown fame?

## **Here is a short excerpt from the book called *Jordan Spieth: Golf Prodigy To Golf Phenomenon: The Inspiring Story Behind Your Favorite Golfer's Humble Success***

The year was 2015. It was just another bright and sunny day, with the sun's rays gleaming atop the bright green blades of grass and on the surface of the nearby ponds. The weather on such a day was ideal for virtually any kind of sport, and on this particular date in February, plenty of aspiring pros had convened to participate in the Masters Tournament.

The Masters Tournament is perhaps the smallest field of the four major golf championships in the world, but it is arguably the most famous. This golf tournament is meant for mainly amateur players who need to fulfill a set of qualifying criteria before they can be invited to participate. For many, it is the pinnacle of amateur tournaments as players need to remain at the amateur level on the first day of the Masters Tournament. For the chosen few, however, a special transformation takes place afterwards. The skilled (and perhaps even lucky) individual who wins the tournament is thought to make the transition from amateur to pro.

The 2015 Masters Tournament ended with an amateur prodigy attaining the 72-hole record set by the renowned Tiger Woods about eighteen years prior. The Tournament's winner also garnered an impressive score of 270 (-18) that

day, along with a whopping USD1.8 million cash prize. As the 6 foot-tall honey blond-haired young man made his way across the course back to his ragtag team composed of some old high school friends, he perhaps had no inkling whatsoever that the next few months would catapult him further into ever-dizzying heights in the world of pro-golf.

Jordan Spieth, 21 years old at the time of his momentous win, would soon go on to become the youngest U.S. Open champion since Bobby Jones. Jones did the same thing back in 1923. Within less than a year, he would also become the defending champion for the 2015 FedEx cup and attain the elusive ranking of no. 1 in the World Golf Ranking.

However, Jordan Spieth wasn't always like this. To understand how this young golf prodigy has managed to prevent the sudden fame and fortune from getting into his head, you must first go back to the beginning of the story. In doing so, you may find that this native Texan's prodigious golf skills or his subsequent foray into the ranks of sporting millionaires could very well be the least of his personal assets. **If you want read more, click on the link below!**

## **Conclusion**

Obviously, you cannot get better at golf without practice. Everything we've just learnt here is theory and useless unless you take action and practice. I hope this book has helped you to understand how to improve your game significantly to reduce your total amount of strokes. Now it is your time to implement what you've just learnt.

Finally, I would love to hear your thoughts on the book. Which tip helped you the most? Do you like the recommended drills? Do you think we should add more tips? Leave a review for the book by clicking on the link below. Any feedback is welcomed!
